

A Wonderful Opportunity for Cataract Patients!

New advances in lens technology can now help you greatly reduce or even eliminate the need for reading glasses or bifocals after cataract surgery. A variety of new technology lenses are available for implantation at the time of your cataract surgery. These intraocular lenses (IOL's) can help you see close, mid-range and at a distance.

During your examination, please ask the technicians or doctor if you are a candidate and which of these lenses would best suit your needs and lifestyle.

There is an additional out of pocket expense over and above what Medicare or your supplemental insurance will cover. However, it is easy and affordable with financing options available. Don't let cost be your only deciding factor.

State of the art equipment and surgical techniques available at The Eye Institute of Utah make cataract surgery simple, easy and fast and these new choices in lens technology might give you amazing visual results.
